Introduction

- **This course applies to all versions from SQL Server 2008 onwards**
 - Some features only apply to SQL Server 2012 and will be pointed out
- **Extended Events was introduced in SQL Server 2008 as a new method of collecting diagnostic data from SQL Server**
- **SQL Trace is a deprecated feature in SQL Server 2012**
 - Deprecated means that it will be removed from a future release of SQL Server but it is still available in the current release
 - This makes understanding Extended Events crucial to supporting SQL Server in the future
- **This course is designed to build on the concepts introduced in the SQL Server: Introduction to Extended Events course on Pluralsight**

Why a Separate Advanced Course?

- **Extended Events has many new concepts and features to understand**
 - The most common topics are covered in the Introduction course to simplify getting started with Extended Events and migrating from SQL Trace
 - The default configurations for session options and other features are typically good enough for most scenarios
- **Some topics apply to less common scenarios and are not practical for everyday usage of Extended Events**
 - Event Tracing for Windows (ETW) integration is useful for understanding internals concepts and how integration between SQL Server diagnostics and Windows diagnostics work together for debugging
 - The .NET API and PowerShell provider for Extended Events provide programmatic access to Extended Events data for third-party vendors and programmers

Course Structure

- **Module 2: Getting more from your Event Sessions**
- **Module 3: Event Session Options**
- **Module 4: Advanced Targets**
- **Module 5: Advanced UI Features**
- **Module 6: Extended Events .NET API and PowerShell Integration**
- **Module 7: Advanced Troubleshooting Scenarios**
